

MIFINGER

- ✓ PASSENGER SCREEN PROTECTION
- ✓ RESTORE THE USE OF TOUCH SCREEN DEVICES
- ✓ ADDED PROTECTION FOR PASSENGERS
- ✓ PROTECT SCREENS FROM HARSH CHEMICALS THAT PASSENGERS MAY USE TO CLEAN THE SCREENS

MiFinger™ Adding a Touch of Protection

MiFinger™ is a finger apparatus designed to be worn on one or more fingers, and serves as a physical barrier between the finger and the screen of any modern interactive touch screen device. The purpose of having this physical barrier is to limit the transfer of germs, diseases, and bodily oils onto the touch screen which can result in illnesses, smears and smudges on the surface of the touch screen that can not only obscure the screen and annoy the user, but also make users sick by making contact with other users' germs.

MiFinger™ uses a durable protective film that is armed with an antimicrobial, scratch, abrasion and chemical resistant hardcoat providing users with a strong shield of security from contact with harmful viruses or bacteria.

Peel It! Stick It! Swipe It! Toss It!

MiFinger™ is a flexible disk that can be molded to fit a variety of finger and thumb shapes. When the user is ready to apply MiFinger™, they simply peel off the sticker and adhere it to their finger(s) of choice. After use, MiFinger™ can be disposed of in the nearest trash receptacle. And, with the antimicrobial protective film, the user doesn't need to worry about germ transfer when removing MiFinger™.

MiFinger™ is proudly made in the USA.
